The Problem

A Human Factors Approach

SpamGUI

Parting Thoughts

Summary

No spam classifier is perfect

Okay in other ML fields, e.g.

• Handwriting recognition, search engines, music recommendation, etc.

But with spam:

- Adaptable, adversarial inputs
- Complexion of dataset severely unbalanced
- High cost of false positives
- Getting from 99.9% to 99.999%

Fighting a losing battle?

Parting Thoughts

- TREC 2007 dataset (~75k messages)
- Classified with SpamAssassin
- How close are mails to the threshold (5)?

R. Beverly (MIT)

Spam & HCI

Spam & HCI

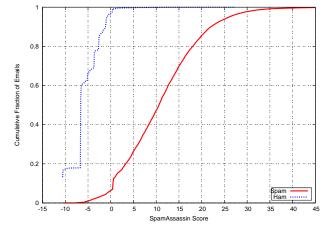

R. Beverly

The Problem

A Human Factors Approach

SpamGUI

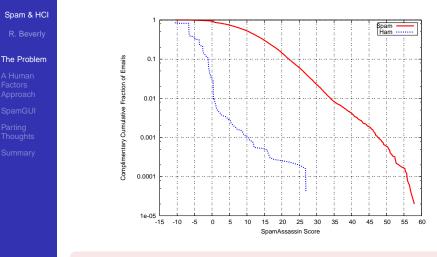

Parting Thoughts

How close are mails to the threshold (5)?
99.72% of ham below threshold... good?

R. Beverly (MIT)

Spam & HCI

- No threshold gives zero FP/FN (well-known compromise)
- Deluge of spam implies this compromise is flawed
- 0.28% above \rightarrow 71 false positives

R. Beverly (MIT)

Spam & HCI

R. Beverly

The Problem

A Human Factors Approach

SpamGUI

Parting Thoughts

Summary

Approaching from a different direction...

The User Agent:

- Users interact with their email via a Mail User Agent (MUA), e.g. Outlook, Hotmail, etc.
- Note that besides going graphical, MUAs have changed little over past \sim 30 years
- Better incorporate human factors into a MUA

The Problem

A Human Factors Approach

SpamGUI

Parting Thoughts

Summary

Human Factors Approach – Potential:

- Make email more useful to the user
 - How are emails presented?
- Humans ultimate arbiter of any mail's importance
 - How to better include, scale their decision process?
- Remove burden of perfect classification from classifier
 - "good enough" filtering

Innovate in the user agent

Spam & HCI

R. Beverly

The Problem

A Human Factors Approach

SpamGUI

Parting Thoughts

Summary

Position

• Separate classification from filtering

The inbox:

- Rethink the inbox: use a **single** mail folder, don't attempt to filter into spam, ham "folders"
- Use color, size, shade, order, and other human factors to present the inbox
- Presentation of email a function of importance

Proof-of-concept: SpamGUI Thunderbird extension...

Spam & HCI

R. Beverly

The Problem

A Human Factors Approach

SpamGUI

Parting Thoughts

Summary

A Few Observations:

- A demarcation "line" naturally emerges to the eye, above which user (or UI) can ignore messages
- User part of filtering process, but only burdened by making spam decisions on a small number of emails around line
- Easy to scan for formerly false positive emails on the threshold border

Lots of work remains:

- No user studies performed yet
- Experimenting with several approaches

R. Beverly

The Problem

A Human Factors Approach

SpamGUI

Parting Thoughts

Summary

More generally:

- Users inundated with information, how can UI help?
- Spam is just one class of very unimportant information
- Lots of unused input "features;" systems designers should use them
- Learn best way to present email to user

Recognize that innovation is possible in the user agent

Summary

Spam & HCI

R. Beverly

The Problem

A Human Factors Approach

SpamGUI

Parting Thoughts

Summary

 We're fighting a losing battle trying to make spam classifiers perfect

Separate act of classification from filtering

 As a community, think more about how HCI / human factors methods can help

Thanks!
